

# Solar Light Instruction Manual

## **How Does The Solar Light Work?**

During the daytime, the solar panel converts sunlight into electricity and charges the battery. At night, the light turns on automatically using the electricity stored.

## **Before First Use**

*Make sure the switch is ON. The switch is on the base part of the brick.*

Put the Solar Light in direct sunlight and charge for 6-10 hours. The light will turn on in the evening automatically.

Select a location with full, direct sunlight. Shady locations will not let the battery fully charge and can reduce the illumination time.

**Note:** The selected location should not be near a night time light source such as a porch or street light, as these might keep the solar light turned off at all times.

Clean the Glass regularly with a soft cloth or paper towel for the best result.

The illumination time depends on the geographical location, weather conditions and seasons etc.

## **Technical Data**

Article Name: Solar Iced-Glass Square

Product Size: Approx. 7\*7\*5cm.

Material: Glass

LED: 1 White LED

Solar Panel: 2V/40mA.

Battery: AAA 300mAh /NI-MH
